

**Velkommen til
CCUS-alliancemøde
14. marts 2024**

Velkomst
v. Kristian Jensen, Adm. Direktør,
Green Power Denmark

Dagsorden for CCUS-alliance møde d. 14. marts 2024

Lokation: Pressen, Vestergade 28, 1456 København K, i lokale "Salen".

Dato: 14. marts 2024, 15.00-17.00

Moderator: Finn Lauritzen, Axcelfuture

15.00-15.05 Velkomst v. Kristian Jensen, Adm. Direktør, Green Power Denmark

15.05-15.25 Den europæiske CCUS-strategi v. Johanna Fiksdahl, CCUS Policy Officer, DG Energy.

15.25-15.40 Etablering af en samlet CO2-infrastruktur – synergier mellem CCU og CCS v. Torben Franch, Regional low carbon fuels lead, DNV

15.40-16.00 Kassø-projektet: erhvervseffekter og eksportpotentiale v. Mathias Aarup Berg, Head of Regulatory Affairs, European Energy

16.00-16.20 Udkast til anbefalinger til dansk CCU-indsats – Kristian Jensen, Adm. Direktør, Green Power Denmark

16.20-16.55 Paneldebat om accelereret CCU-indsats:

Ulrik Stridbæk, Chef for Regulatory og Public Affairs, Ørsted

Lisbeth Sørensen, Business Opportunity Manager, Crossbridge

Charlotte Søndergren, Direktør for forsyningsstrategi og vind, HOFOR

Sara Westphal E. Neergaard, Director of Communication and Public Affairs, Denmark Norwegian

Jacob K. Clasen, Viceadm. Direktør, Danske Rederier

16.55-17.00 Eventuelt og øvrige arrangementer

Charlotte Larsen, DTU Offshore, invitation til kommende arrangement

Herefter byder Green Power Denmark på et glas bobler og lidt snacks

Den europæiske CCUS-strategi

v. Johanna Fiksdahl, CCUS Policy Officer, DG Energy

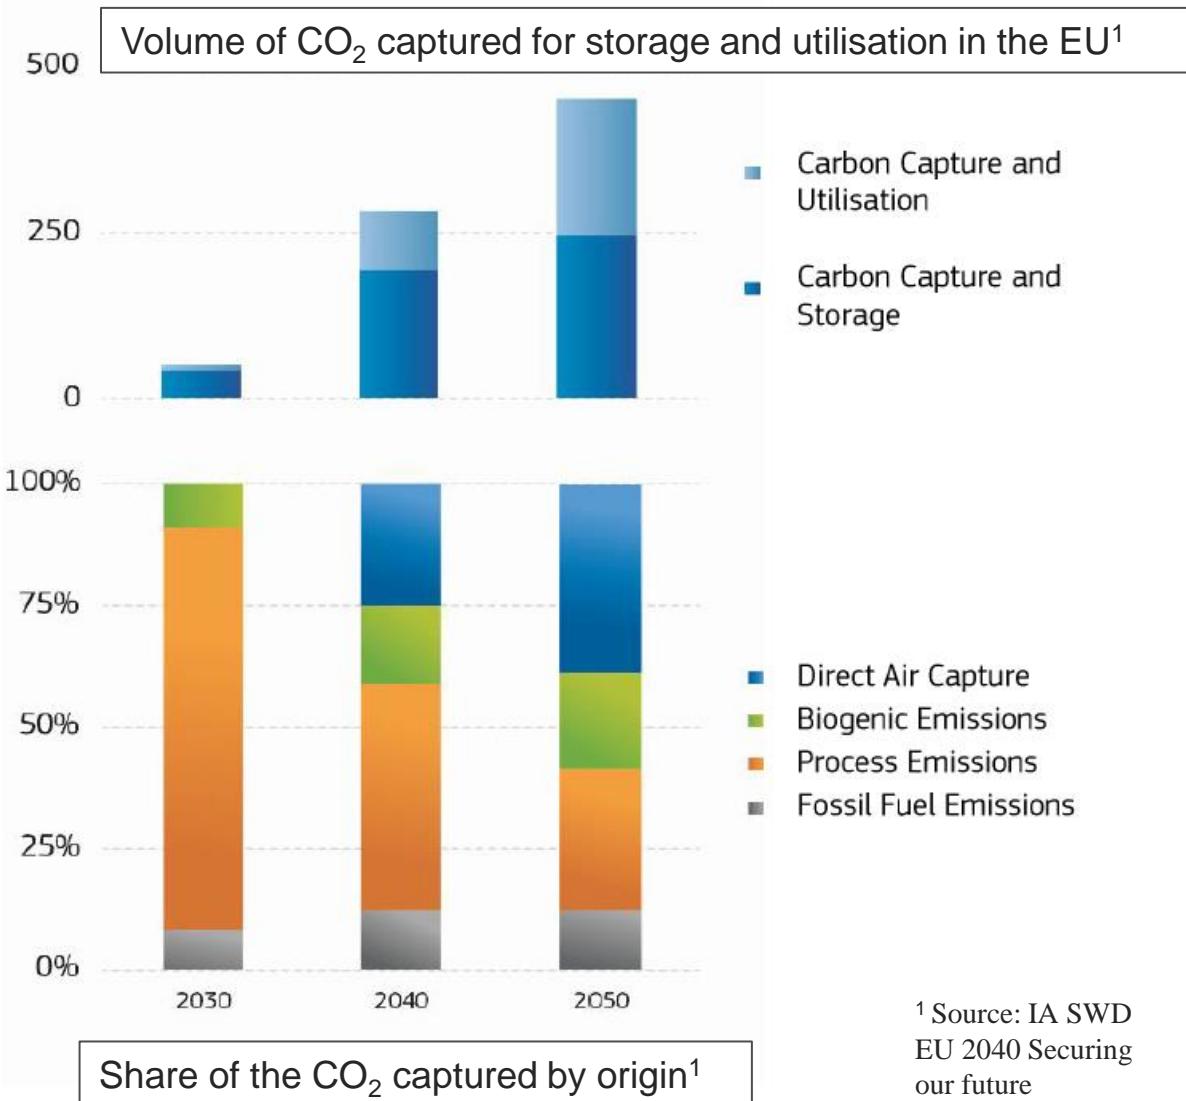

Towards an ambitious Industrial Carbon Management (ICM) for the EU

Johanna Fiksdahl, DG ENER

The 2040 Climate Target Communication

- ICM essential complement to mitigation that is necessary in the first place
- ICM key to reduce and manage carbon emissions in industrial processes
- Then, need for a shift towards biobased and air-captured CO₂ streams
- CO₂ capture needs:
 - 2030: ~50 Mtpa
 - 2040: ~280 Mtpa (~250 Mtpa for storage)
 - 2050: up to 450 Mtpa
- **EU today: 10 Mtpa capture projects supported by the Innovation Fund – no CO₂ storage site operational**

Industrial carbon management in Europe

EU Level

- NZIA: CCS as a strategic net-zero technology. 50 Mtpa storage target with investment obligation
- CCS Directive
- EU ETS + EU Innovation Fund
- RFNBOs and synthetic fuels
- Carbon Removal Certification Framework
- 14 CO2 projects in the 1st PCI/PMI list under TEN-E: 5 awarded CEF
- CCUS Forum: plenary + WGs, new ones to be established for 2024

MS Level

- 20 MS include ICM in NECPs
- 7 MS include ICM in Recovery and Resilience Plans
- DK, NL + NO w/ ICM subsidies and pioneering CO2 storage
- FR, DE & AT developing ICM strategies

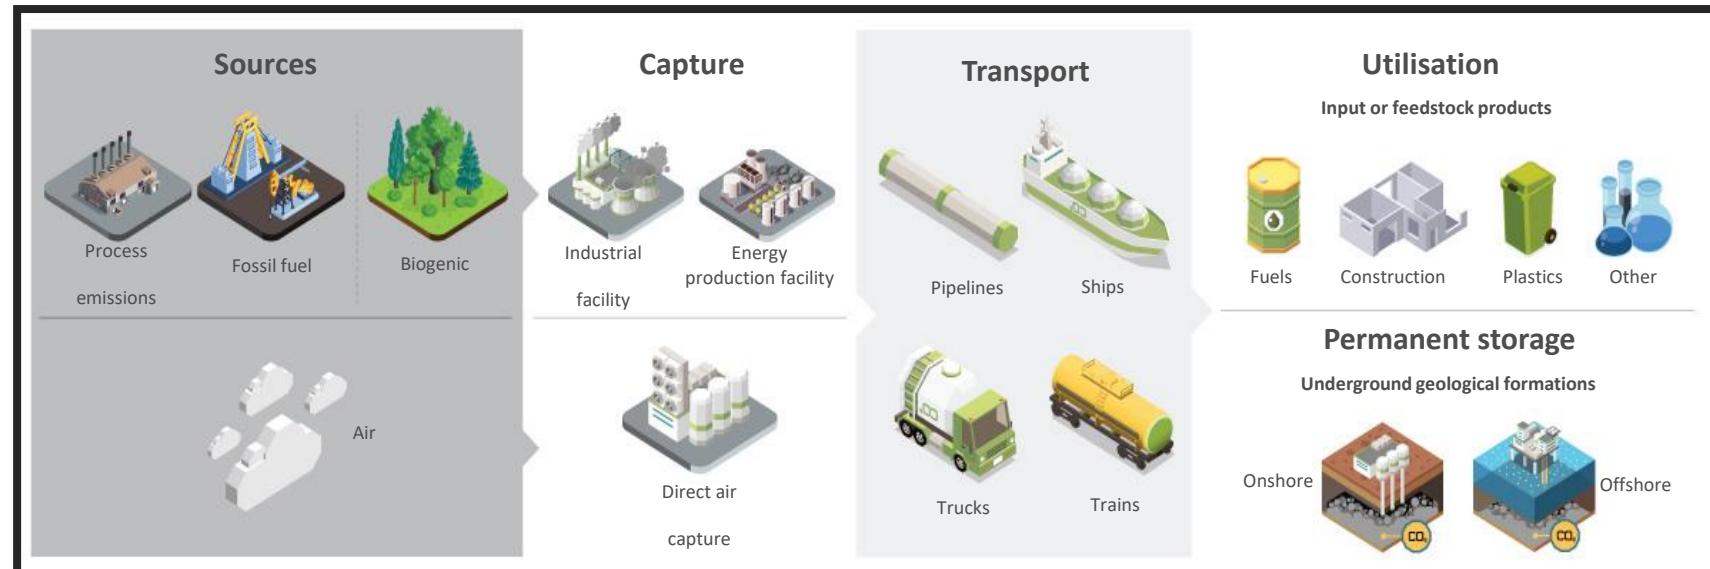

Three pathways and transport as key enabler

The strategy focuses on three main technological pathways:

- Capturing CO₂ emissions for storage (CCS)
- Removing CO₂ from the atmosphere (BioCCS and DACCS)
- Capturing CO₂ for utilisation (CCU)

CO₂ transport infrastructure = **key enabler** necessary to establish a fully-fledged CO₂ market in Europe.

Capturing and storing CO₂

Aim(s): Decarbonisation option for industry (ETS = incentive).

Challenge(s): No operational storage sites (NZIA), no storage market, limited bargaining power, lack of geological data, insufficient investments.

Commission will develop:

- **CO₂ demand aggregation platform** to match demand and supply for storage.
- **CO₂ Storage Atlas for the EEA** to identify several gigatonnes of investable geological storage capacities for 2040 and beyond
- **Guidance:** CO₂-specific value chain “leakage” risks, transfer of storage responsibility, and financial security requirements under CCS Directive.

Member States:

- support **Net Zero Strategic Projects** under NZIA.
- Facilitate **storage permits**
- Empower geological services to create **CO₂ Storage Atlas for investors**.

Removing CO₂ from the atmosphere

Aim(s): Support industrial carbon removals are key to EU climate neutrality.

Challenge(s): Not fully recognized by existing legislative framework, cost of carbon removals, different stages of maturity.

Commission will:

- **Assess overall objectives for carbon removals** in line with the 2040 climate ambition and the achievement of climate neutrality by 2050 and negative emissions thereafter.
- **Develop policy options and support mechanisms**, including if and how to account for them in the EU ETS.
- **Boost EU research, innovation and early-of-a-kind demonstration** for novel industrial technologies to remove CO₂ with resources under Horizon Europe and the ETS Innovation Fund.

CO₂ utilisation

Aim(s): Recognise CO₂ as a valuable resource, to replace fossil carbon with real climate benefits.

Challenge(s): Heterogeneity of CCU pathways, accounting framework not fit for all CCU purposes, no price incentive for some types of CCU.

Commission will:

- **Consider options for higher uptake** of sustainable carbon as a resource in industrial sectors.
- **Establish a coherent framework for the accounting of all industrial carbon management activities** to accurately reflect the climate benefits along their value chains.

CO₂ transport infrastructure

Aim(s): A single CO₂ market for Europe: non-discriminatory, open-access, transparent, multimodal, cross-border. Harmonisation and flexibility

Challenge(s): High upfront costs, complicated coordination across value chains, lack of business case.

Commission will:

- Initiate preparatory work for a possible future **CO₂ transport regulatory package**.
- Work towards an EU-wide **CO₂ transport infrastructure planning mechanism**.
- Consider nominating **European coordinators** to support the early development of (cross-border) infrastructure projects.
- Develop **emissions accounting rules** in the context of the EU ETS.
- Work with the European standardisation bodies to establish minimum **standards for CO₂ streams**.
- Promote through the International Maritime Organization the development of **guidelines on safe transportation of CO₂ by sea**.

Investments and funding

Status quo: Already a number of EU policies in place to support ICM:

- EU ETS + EU IF: 26 CCS/CCU projects, > 3.3 BNEUR
- PCI/PMI under TEN-E and CEF: 14 CO₂ projects of which 5 awarded CEF

Aim(s): Support first-of-a-kind deployments in the EU.

Challenge(s): first-of-a-kind projects are costly but need to scale up the market.

Commission will:

- Work with MS, to make use of **JEF-IPCEI**, in the context of ICM.
- Consider **market-based funding mechanisms** (such as competitive bidding auctions as a service under the IF) for certain ICM technologies
- Engage with the **EIB** on financing of CCS and CCU projects.
- Announcing the assessment of **investment needs for ICM up to 2040 and 2050**.

Conclusion

Member States and the Commission need to work together to increase certainty for investors and to ensure real and quantifiable environmental benefits.

- To reach climate neutrality by 2050 the EU needs a policy framework for industrial carbon management.
- The technological solutions to capture, transport, use and store CO₂ are available, but need to be deployed at scale, both avoid emissions in industry / energy production and to start removing CO₂ from the atmosphere.
- Theoretical geological CO₂ storage possibilities and CO₂ transport infrastructure need to become bankable climate solutions.
- Captured CO₂ is a valuable commodity that should be used.

Etablering af en samlet CO₂-infrastruktur – synergier mellem CCU og CCS

v. Torben Franch, Regional low carbon fuels lead, DNV

Denmark as a European CO2 hub

Introduction

Why Denmark as a CO2-hub?

For CO2hub Europe, DNV has analysed two scenarios for developing a Danish CO2 infrastructure.

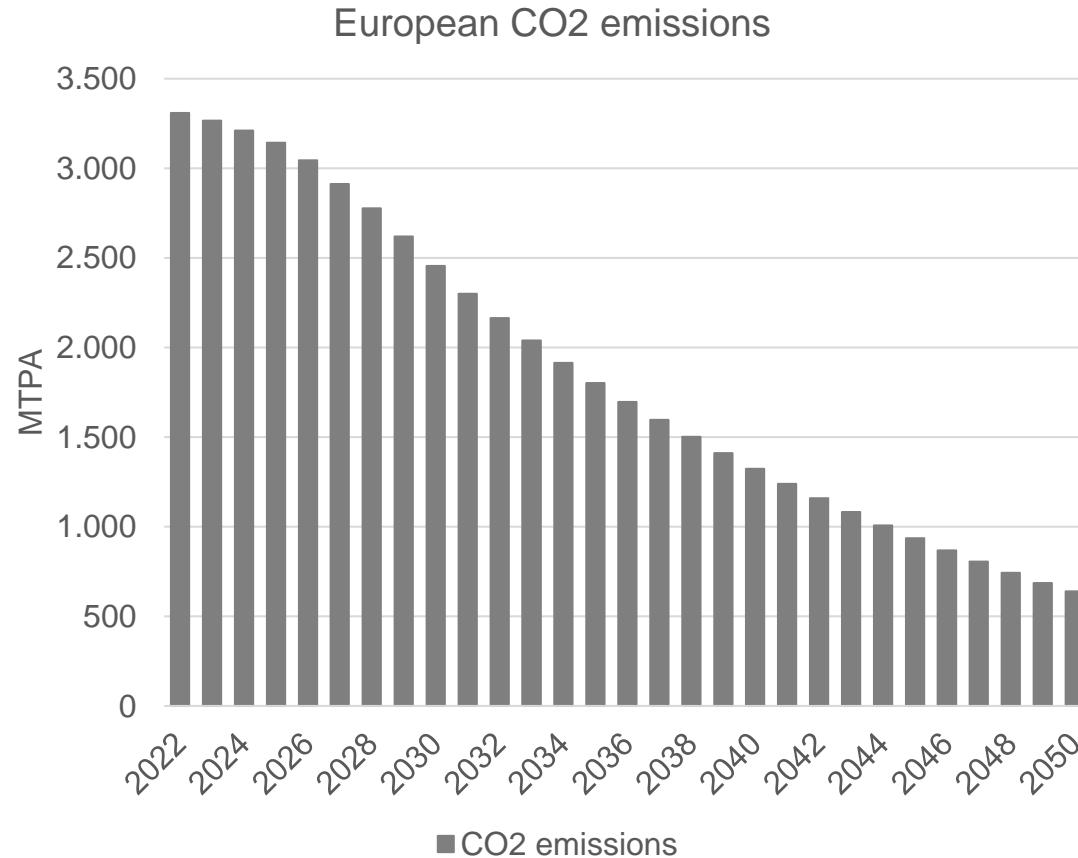

Why Denmark as a CO2 hub:

- CCS is part of strategy for reaching Danish and EU climate targets
- Good potential for CO2 storage sites
- Neighbouring countries need CO2 storage

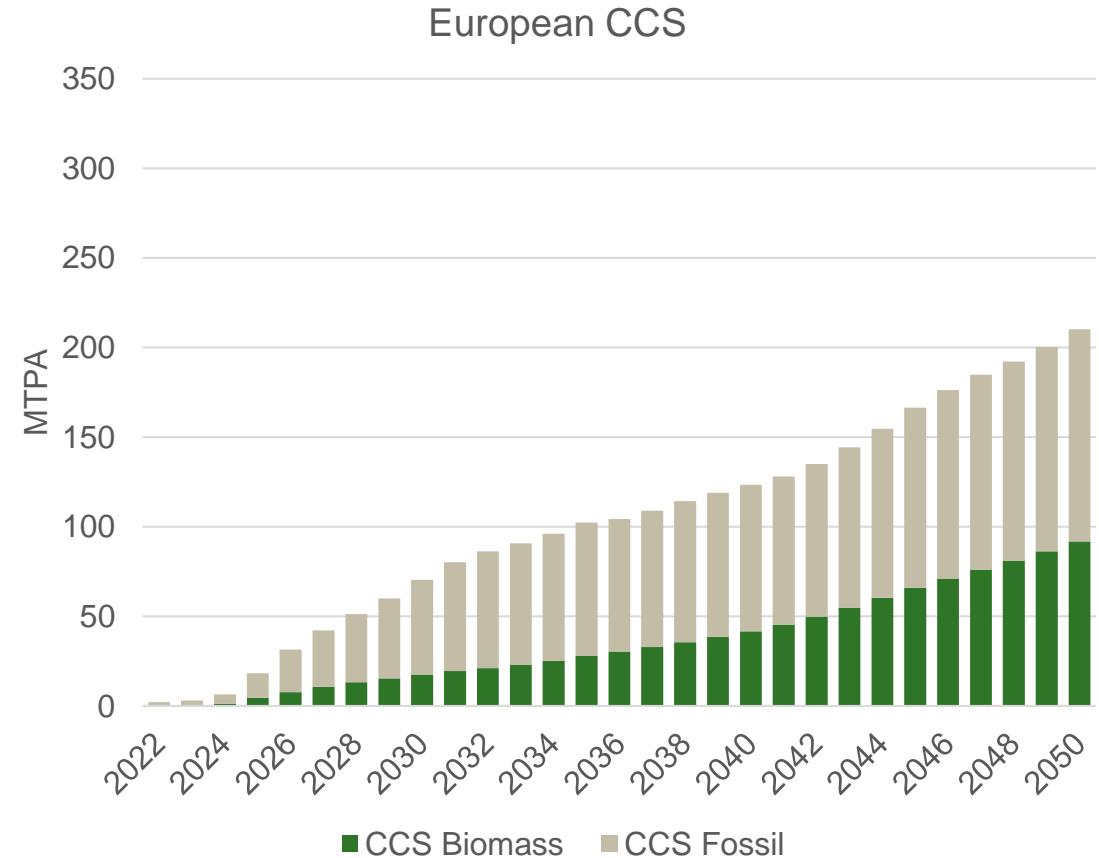

European market for CCS

CCS is an important contribution to European CO2 neutrality but not a fix all

Source: DNV ETO 2023

Source: DNV ETO 2023

The report

Denmark as a European CO2 hub

The report maps and evaluates scenarios for the business potential of a CO2 storage industry in Denmark.

The report covers four main topics:

1. Market and Regulatory Review
2. Scenario Development
3. Cost Estimation
4. Cost-Benefit Analysis

Two main scenarios:

- “Each on their own” – an uncoordinated, project-by-project development
- “Build and they will join” – a coordinated, integrated development

“Each on their own”

Project-by-project development scenario

An uncoordinated project-by-project scenario based on current political incentives:

- Uncoordinated capture projects and storage projects
- Onshore storage development is expected to start later and take longer compared to the development of Danish capture projects

Positive results from the cost-benefit analysis gives positive results, but

- economic efficiency is lower than in the coordinated scenario
- captured Danish CO₂ is exported and imported CO₂ is stored in Danish storages

MTPA	Captured CO ₂	Imported CO ₂	Exported CO ₂	Injected CO ₂	Total
Ålborg	1	2.5	-0.5		3.0
Gassum				-3.0	-3.0
Esbjerg	0.3		-0.3		0.0
Kalundborg	0.5	3.0	-0.5		3.0
Havnsø				-3.0	-3.0
København	1.6		-1.6		0.0
Total	3.4	5.5	-2.9	-6.0	0.0

Source: Google Maps. Location of Ports has been applied manually.

“Build and they will Join”

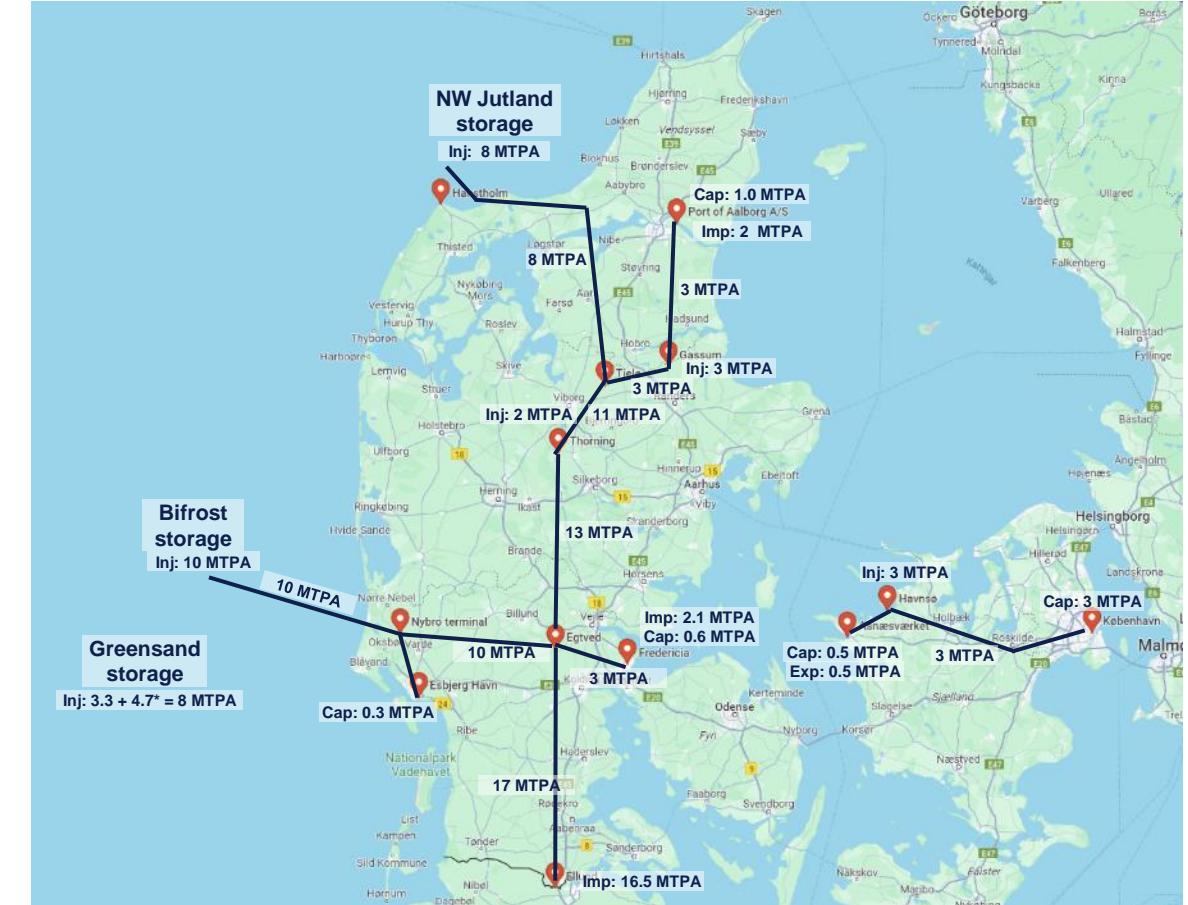

Coordinated scenario

Coordinated development of storage sites and backbone pipeline grid.

- Planned, built and in operation simultaneously - in a rough 2030 timeline.
- Pipeline infrastructure designed to facilitate the expected storage capacity and take into account domestic and imported CO₂ volumes.

The coordinated scenario will probably require a degree of government participation and coordination and in return:

- Better economic efficiency and higher socio-economic value
- Better facilitation of Danish CCUS as CCS and PtX does not have to be co-located
- Captured Danish CO₂ is stored in Danish storages and significant contribution to storage of CO₂ emissions from neighbouring countries
- Investing in infrastructure instead of spending money on shipping

Source: Google Maps. Location of storage sites has been applied manually.

Main findings

What do the scenario outcomes show us?

1. Investments are significant but also potential benefits
2. Lead times and coordination of project planning across the value chain is key
3. Economies of scale and import volumes are vital to realise a substantial CCS-industry in Denmark and to effectively support CCU
4. If a backbone-based CCS-industry is developed, Denmark can have a competitive edge compared to other European countries developing CO2 storage

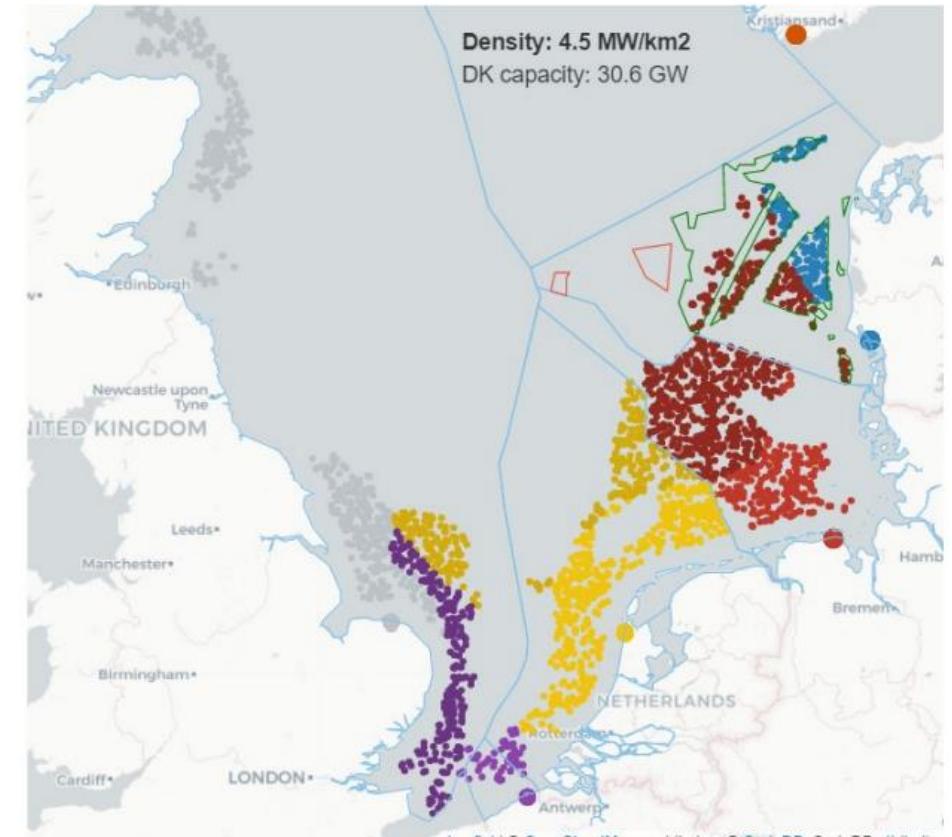

But it is also about CCU

Realising the Danish offshore wind potential

1. Denmark has a very significant potential for producing electricity from offshore wind
2. Building electric interconnectors are expensive and time consuming
3. The Danish hydrogen backbone is a key part of the infrastructure
4. And there is an opportunity producing eFuels such as eAmmonia, eMethanol and eSAF for maritime and aviation industries

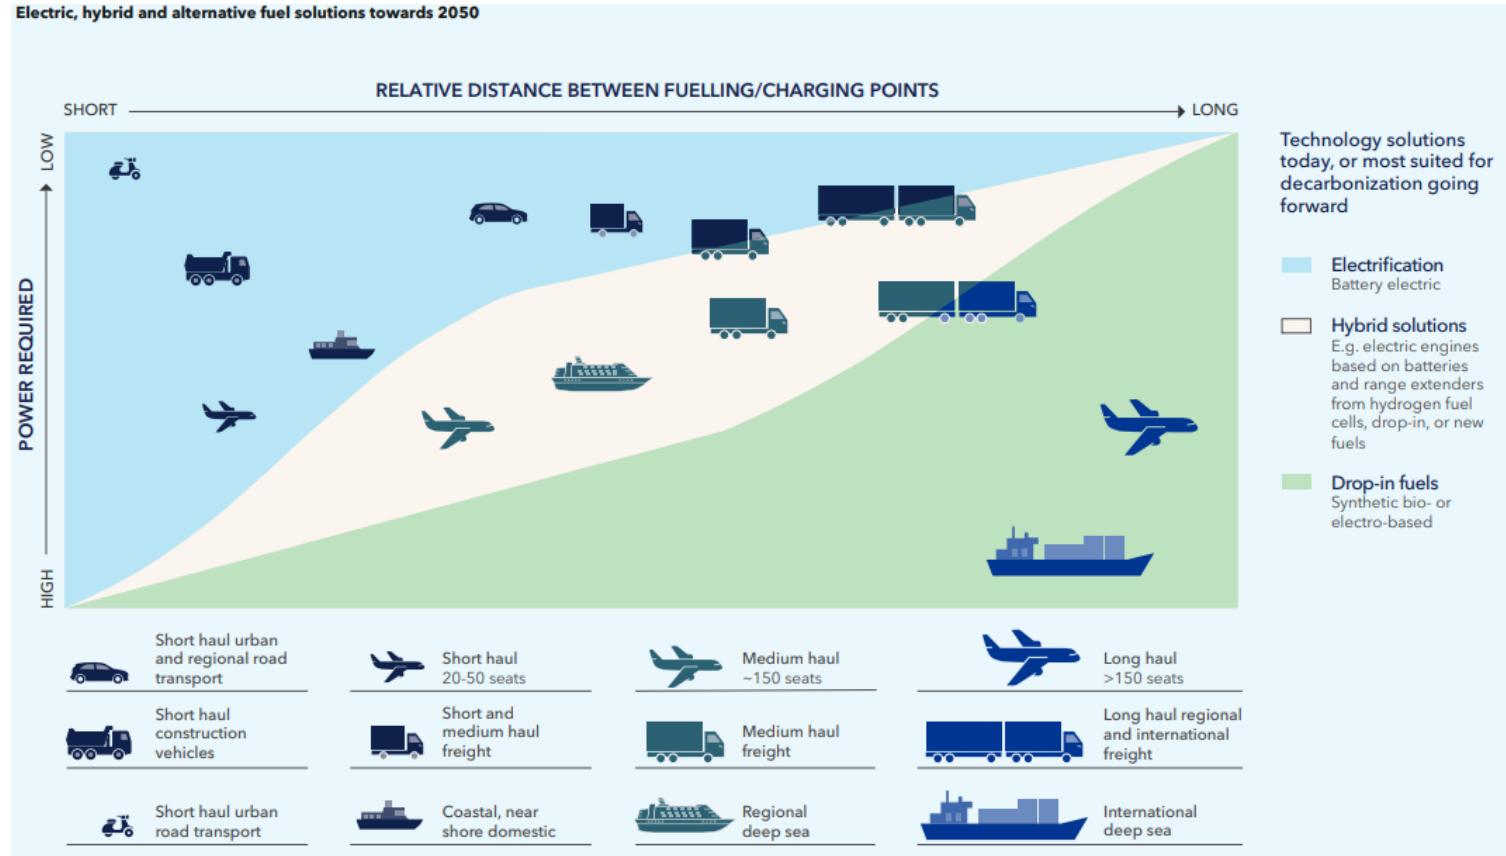

Chart 4: Scenario for cost-effective distribution of approx. 250 GW capacity

Source: Energistyrelsen (2022)

DNV ETO: Pathways to decarbonising transport

Electricity, hydrogen, then bio- and efuels

Source: DNV, Transport in transition (2023)

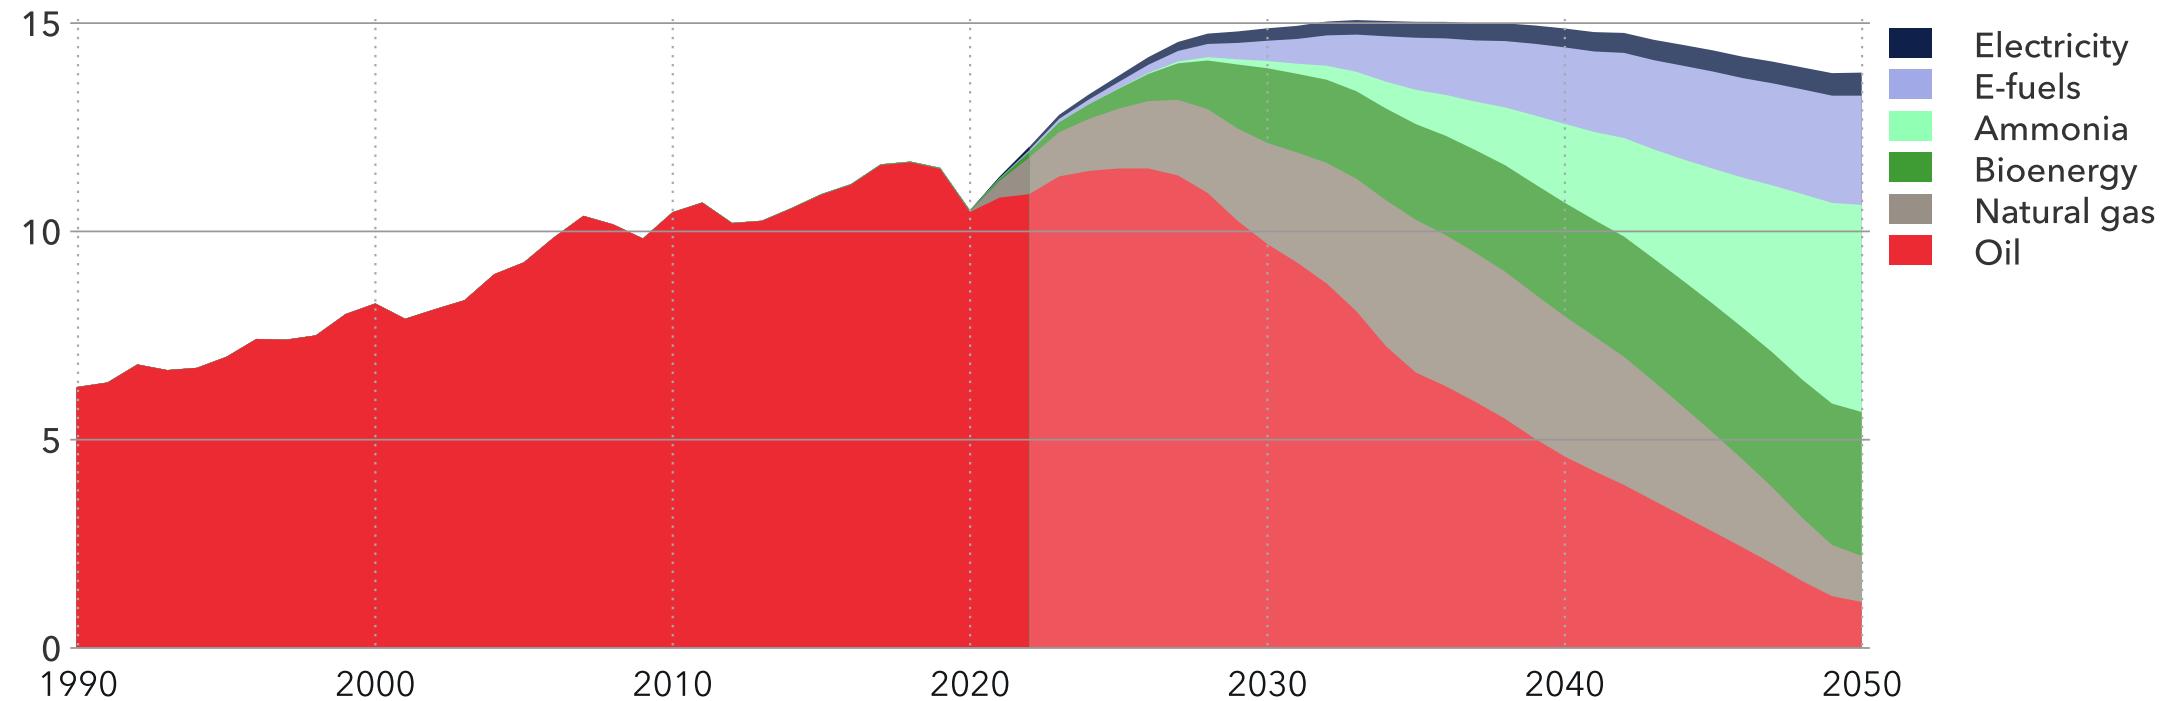

- Barriers to electrification:
 - One reason that not all energy use can be electrified is the low energy density of batteries
 - If you require storing large amounts of energy, drop-in fuels offer a solution
 - Drop-in fuels have the same properties as conventional fuels and can be used in existing engines and infrastructure
 - Sustainable drop-in fuels can be made from biomass, waste or electricity+CO₂ (e-fuels)

DNV Energy transition outlook 2023

The maritime fuel mix will change dramatically

World maritime subsector energy demand by carrier

Units: EJ/yr

Source: DNV, Energy Transition Outlook (2023)

EU regulation 2023

Driving decarbonization and uptake of sustainable fuels

Renewable energy directive (RED) emission and renewable target (2023):

- Binding target of 42,5% of all energy in 2030 from renewable sources

RED binding target for the transport sector:

- 14.5% reduction in GHG emissions by 2030 or at least 29% renewable energy in the fuel mix
- Sub target of 5.5% energy from advanced biofuels (non-food) or RFNBO* (at least 1% RFNBO)

RED binding target for industry:

- 42% of hydrogen (current use) must be RFNBO by 2030 (60% in 2035)

Aviation

Blending mandates on **fuel suppliers** for sustainable aviation fuels (SAF) and renewable fuels of non-biological origin (RFNBO):

- | |
|-----------------------|
| 2025: 2% SAF |
| 2030: 6% (0.7% RFNBO) |
| 2035: 20% (5% RFNBO) |
| 2040: 34% (8% RFNBO) |
| 2045: 42% (11% RFNBO) |
| 2050: 70% (28% RFNBO) |

Maritime

GHG reduction requirements on vessel operators:

- | |
|-------------|
| 2025: 2% |
| 2030: 6% |
| 2035: 14.5% |
| 2040: 31% |
| 2045: 62% |
| 2050: 80% |

From 2024, Shipping is part of ETS mechanism

*RFNBO = Renewable Fuels of Non-Biological Feedstock (= hydrogen, ammonia and e-fuels from renewable electricity)

Early adopters: Shipping operators looking for biomethanol and eMethanol

When one shipowner turned, the marine market turned towards methanol

The collage consists of several news snippets and images from shipping industry websites:

- Container News:** COSCO places orders for 12 methanol-powered giant ships (October 31, 2022)
- Brookes Bell:** HMM Orders Nine Methanol-Fuelled Containerships
- TradeWinds:** Evergreen follows Maersk with \$4bn methanol container ship push, despite fuel bill fears
- Ship & Bunker:** CMA CGM Moves Ahead of Maersk on Methanol Powered Ship Orders (Wednesday April 12, 2023)
- Offshore Energy:** X-Press Feeders orders six methanol dual-fuel boxships

Source: MAN Energy Systems (2023)

In conclusion: Combining CCS and CCU

1. CO2 infrastructure can facilitate development of a Danish CCS industry
2. Realising potential for CCU will probably require CO2 certification and mass balancing
3. CCS and CCU possibly require support regimes. Make sure that CCS does not get in the way of CCU

Kassø-projektet: erhvervseffekter og eksportpotentialer

v. Mathias Aarup Berg, Head of
Regulatory Affairs, European Energy

14. marts, 2024

Kassø: Erhvervseffekter og eksportpotentialer

Mathias Aarup Berg – Head of Regulatory Affairs

EUROPEAN
ENERGY

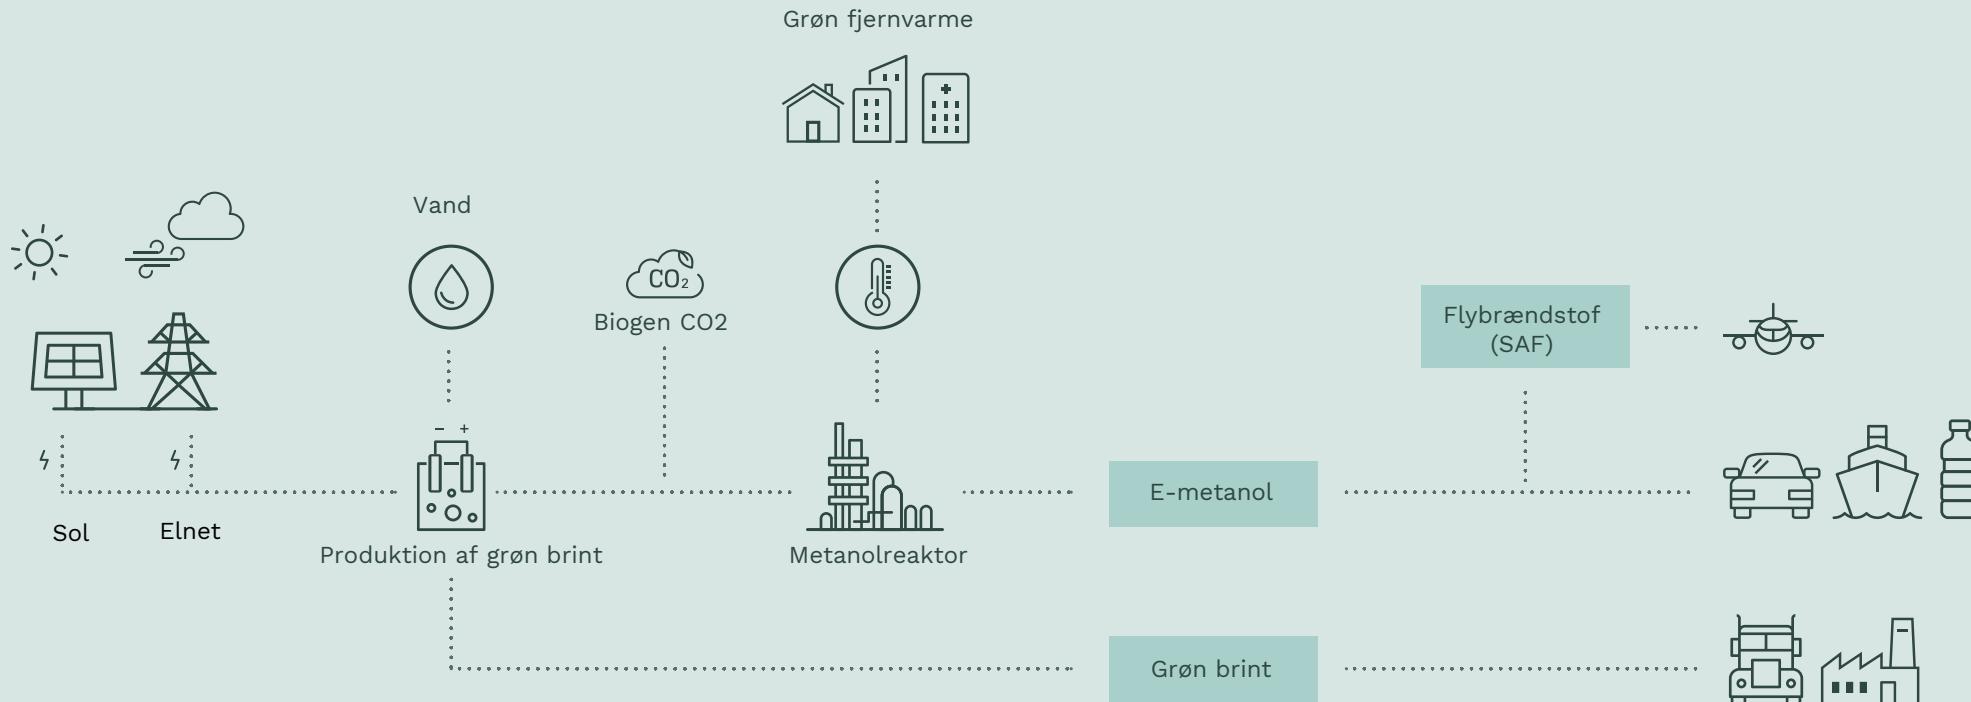

Kassø Power-to-X-anlæg

- European Energys første – og **verdens største** – storskala e-metanol-anlæg idriftsættes i 2024
- Anlægget kan producere op til **42.000 tons e-metanol** (50 mio. liter) om året, når det er i fuld produktion
- Produktionen er afsat til **Maersk, Lego og Novo Nordisk**, der erstatter henholdsvis skibsbrændstof og fossil metanol.
- Brugen af e-metanol fra Kassø vil **reducere udledning af fossil CO2** med op til 80.000 tons

EUROPEAN
ENERGY

Fremstilling af e-metanol på Kassø Power-to-X-anlæg

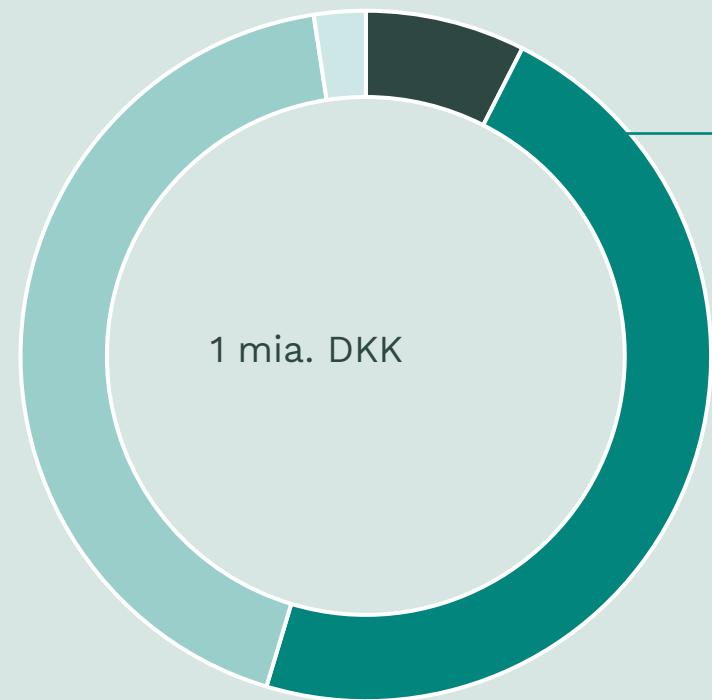

Konstruktionen af anlægget startede i maj 2023, og siden er det gået stærkt...

Et e-metanolanlæg er en milliardinvestering

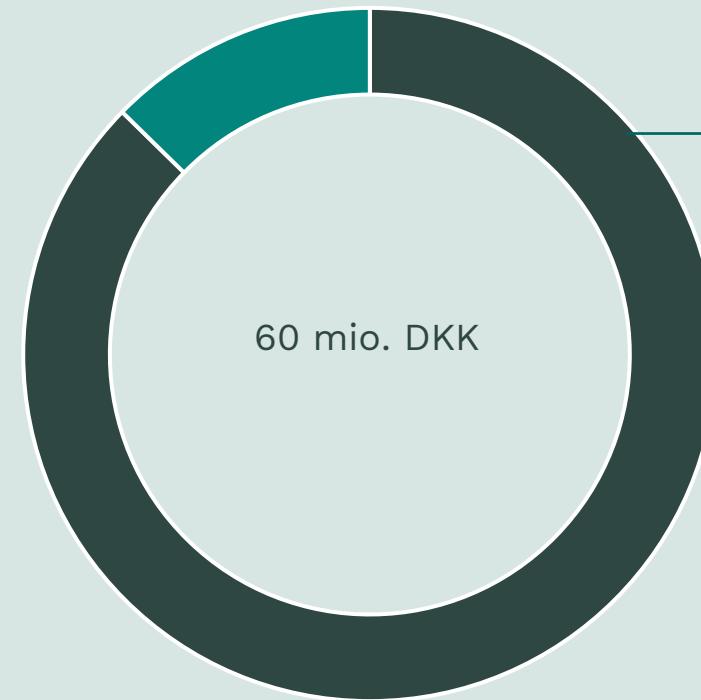

European Energy prioriterer lokale, danske og europæiske leverandører

Leverandører til Kassø Power-to-X

Soft & Teknik
Siemens Energy
Solid Energy
Airco
Adding
Cowi
AlfaLaval
m.fl. (+50)

Leverandører til CO2-fangstanlæg ved Tønder Biogas

Soft & Teknik
Danfoss
Vestas Air
Cooling
DanaTank
Axflow
m.fl.

■ Lokale ■ Danmark ■ EU (inkl. UK) ■ Uden for EU

■ Danmark ■ EU

Jobskabelse og lokale arbejdspladser

+60

Mange af European Energys **60 medarbejdere** inden for Power-to-X er aktivt involveret i projektet og får støtte fra eksterne rådgivere

+100

Over **100 fultidsmedarbejdere** i anlægsfasen, hvoraf halvdelen er lokale

+30

Op til **30 fultidsmedarbejdere** vil stå for den løbende drift, når anlægget er færdigt

Et hav af **underleverandører** til service på anlægget, transport af e-metanol, drift af havneterminal etc.

Kassø er grundstenen for fremtidige anlæg – i Danmark og resten af verden

DANMARK

2 projekter under opførelse

- E-metanolanlæg ved Kassø, Aabenraa
- Brintanlæg ved Måde, Esbjerg

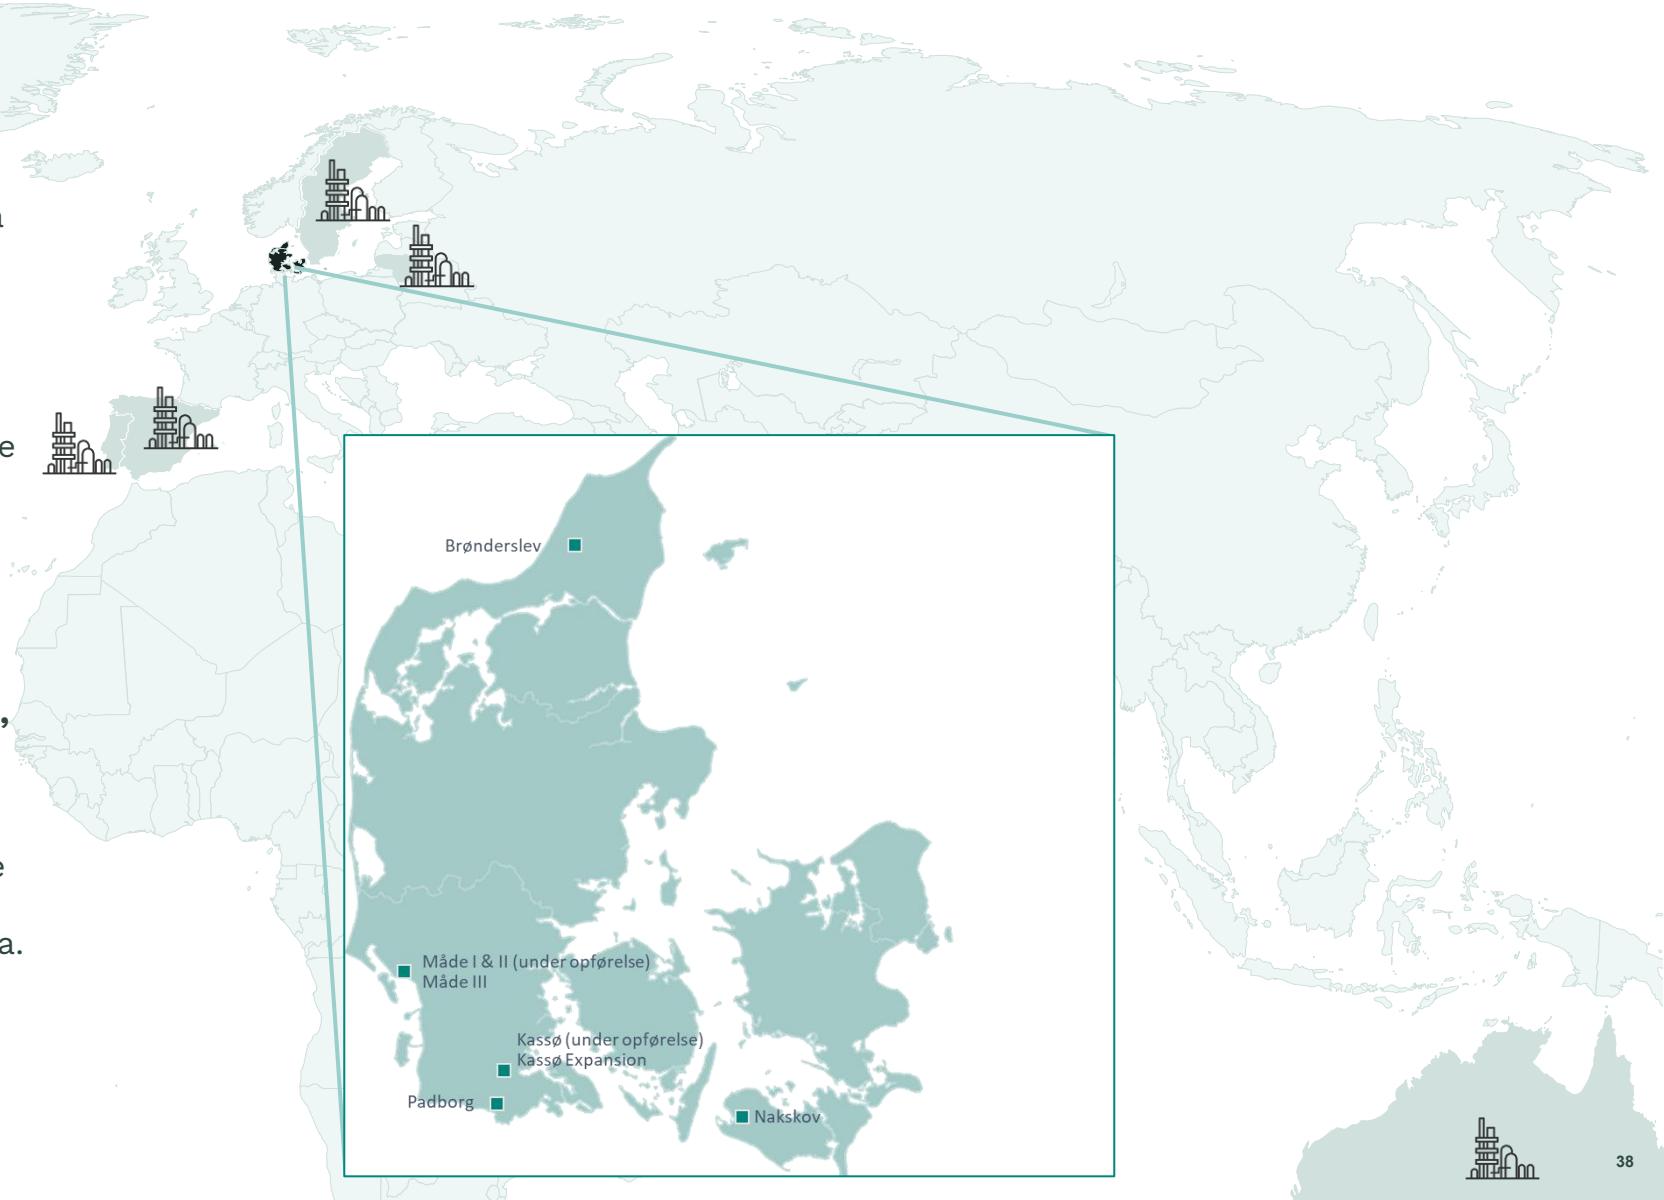

En række andre projekter under udvikling

- Bl.a. Padborg, som var blandt vinderne af PTX-udbudet, og som koblet til 2 af energiparkerne på land vil være 3 gange større end Kassø

RESTEN AF VERDEN

Stærkt fokus på Norden, Baltikum, USA, Brasilien og Australien

- Pipeline af e-metanol projekter baseret på European Energys pipeline af vind- og solprojekter samt gode forhold for PTX-produktion lokalt (bl.a. IRA i USA)

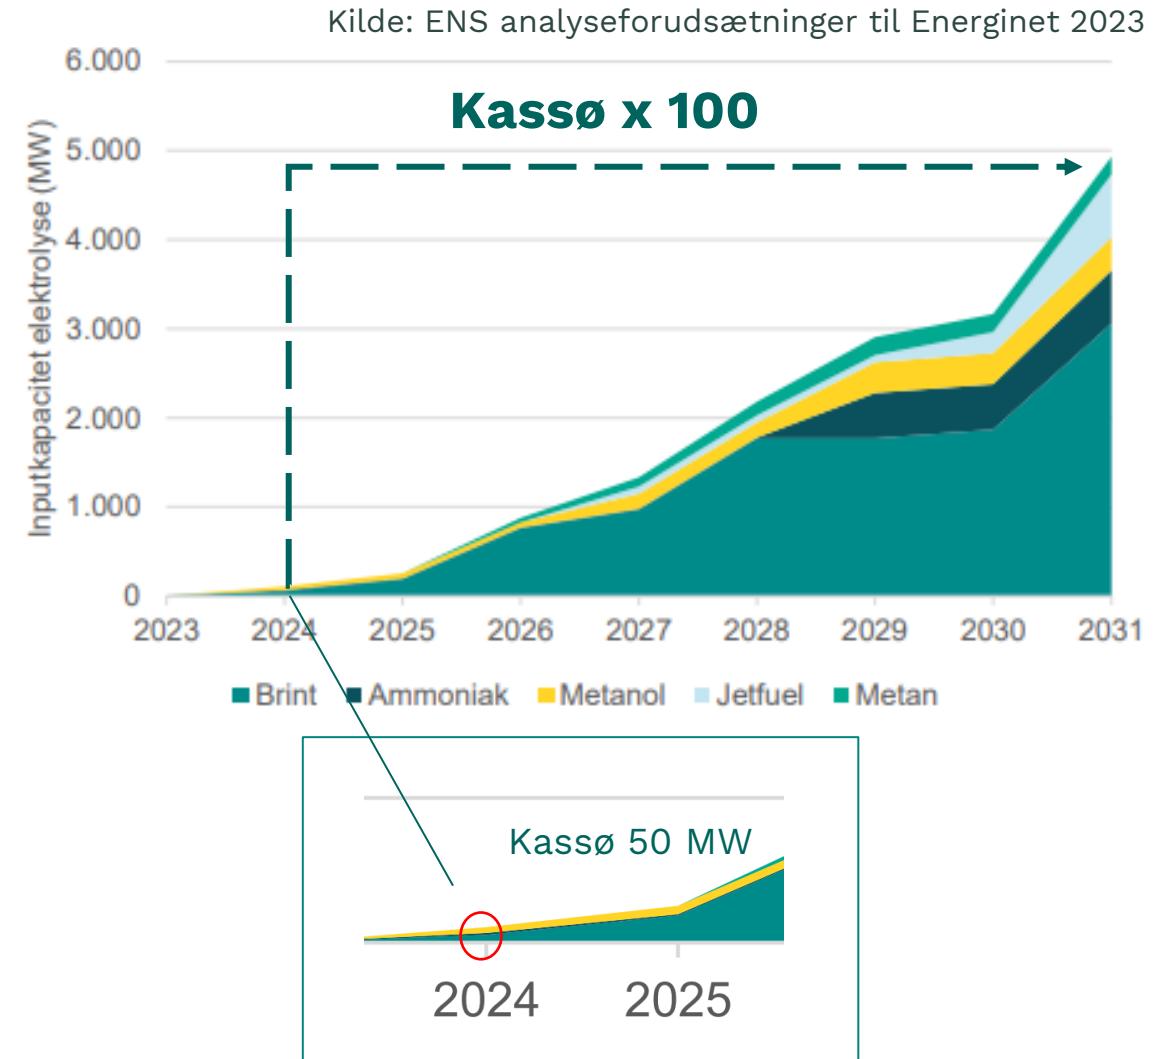

De første skridt i PtX-industrialiseringen er taget – og næste skridt skal følge hurtigt efter

- Kassø er et lille stort skridt i industrialiseringen
- National målsætning fra PtX-aftale om 4-6GW elektrolysekapacitet i 2030 kræver:

Kassø X 100

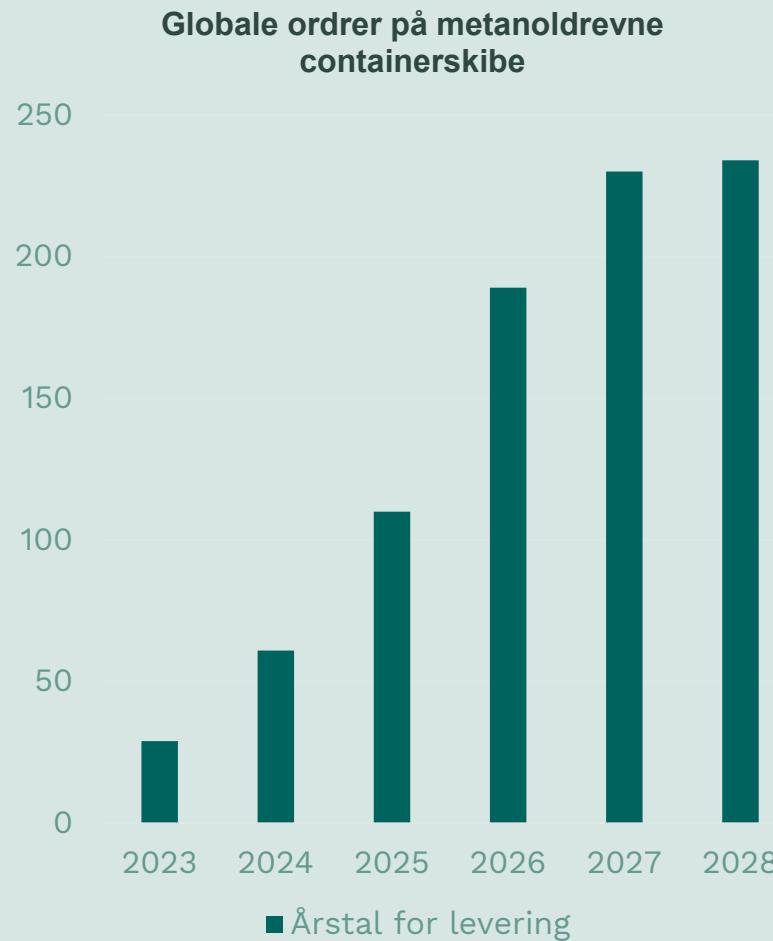

- Vi er allerede kommet godt fra start, men rammevilkår og støtte skal sikre acceleration af PtX-produktion i Danmark via:
 - Brintinfrastruktur
 - PtX-udbuddet vol. 2 (Auction-as-a-service i EU Hydrogen Bank)
 - Ensartet myndighedsbehandling med de rette kompetencer og ressourcer

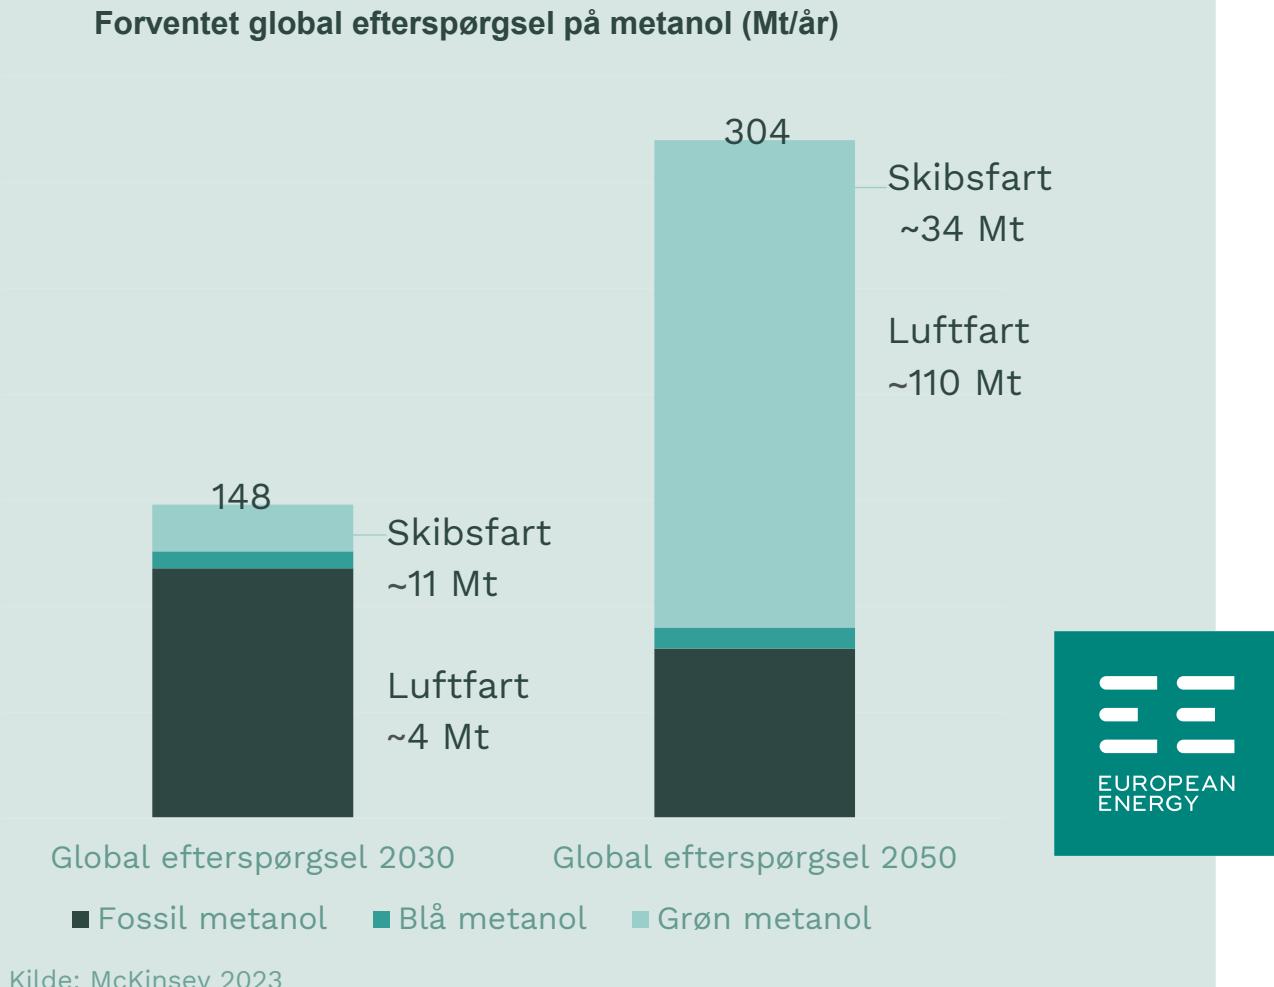

Global efterspørgsel skaber danske eksportmuligheder

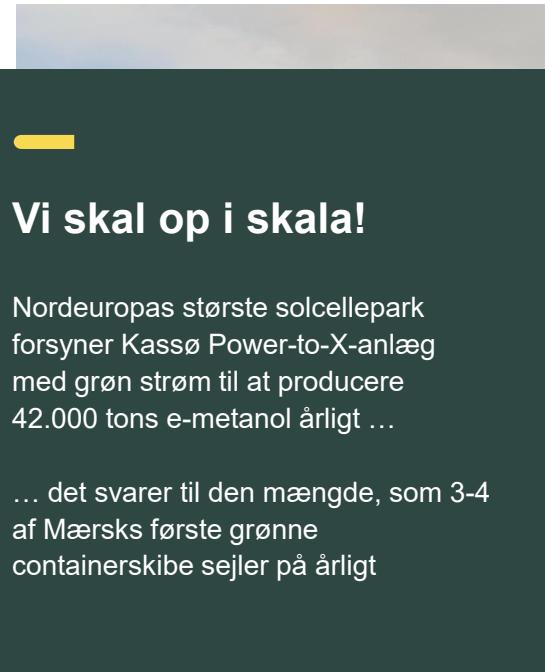

Alene i shippingindustrien vil behovet for e-metanol stige støt

Kilde: DNV Alternative Fuels Insight 2023

Vi skal op i skala!

Nordeuropas største solcellepark
forsyner Kassø Power-to-X-anlæg
med grøn strøm til at producere
42.000 tons e-metanol årligt ...

... det svarer til den mængde, som 3-4
af Mærsk's første grønne
containerskibe sejler på årligt

Danmark kan imødekomme global efterspørgsel

- ✓ Vi har store mængder **grøn strøm** – og får endnu mere gennem havvindsudbud og energiparker på land
 - VE-andel i elnettet på over 90% inden for få år
- ✓ Vi har **biogene punktkilder**
 - Biogasproduktion udleder biogen CO2, som ved hjælp af carbon capture-teknologier kan bruges i Power-to-X
 - Biogas er en kilde til CO2 i meget høj koncentration og dermed nemt og energieffektivt at fange
- ✓ Vi har et **økosystem** af eksperter fra universiteter, teknologileverandører og tradition for sektorkobling
 - En know-how til gavn for indenlandsk produktion og eksport af dansk Power-to-X-teknologi

= En helt unik styrkeposition

Tak for jeres
opmærksomhed!

DTU Offshore - CCS conference – 2024

CO₂ storage in Denmark – Risks and Uncertainties

Storage of CO₂ is a key part of Denmark's road towards negative emissions in 2050 and at the same time Denmark has an ambition of becoming a CO₂ storage hub for Europe. The technologies behind the storage of CO₂ are mature, however, there are remaining risks and uncertainties when it comes to implementation. This conference will focus on the risks/uncertainties associated with CO₂ storage in Denmark, looking at both offshore and onshore storage sites. The risks and uncertainties which will be addressed are covering a wide range of issues from lack of high-quality data.

Confirmed speakers (more to come):

Denmark's Youth Climate Council
